AFOLIQUE – THEME DOCUMENTATION

Author: Vuzz

First of all thank you for purchasing my theme and don't forget to back up the original before starting to make any changes . Notepad++ is the editor I use, it is free and you may find it useful too for editing your theme.

If you like this file you may like some of my other items found on WrapBootstrap market. Visit portfolio. Thank you so much!

HTML STRUCTURE

This theme is a fluid responsive layout theme, HTML 5 valid, perfect for portofolio sites. It has 2 main columns: a fixed left sidebar and main content.

1. **The sidebar is wrapped within class span3, while the main content within span9:**

```
<div class="row-fluid">
        <div class="span3">Sidebar</div>
        <div class="span9">Main content</div>
</div>
```

2. **Within main content, you can create other columns:**

Single column in main content (full width) :

```
<div class="row-fluid">
        <div class="span12">Content here</div>
</div>
```

Two columns in main content :

```
<div class="row-fluid">
        <div class="span6">Content here</div>
        <div class="span6">Content here</div>
</div>
```

Three columns in main content

```
<div class="row-fluid">
        <div class="span4">Content here</div>
        <div class="span4">Content here</div>
        <div class="span4">Content here</div>
</div>
```

Four columns in main content

```
<div class="row-fluid">
        <div class="span3">Content here</div>
        <div class="span3">Content here</div>
        <div class="span3">Content here</div>
        <div class="span3">Content here</div>
</div>
```

As you can easily notice, this is a 12-column grid, each `.span*` spans a number of those 12 columns, and should always add up to 12 for each row (or the number of columns in the parent). In conclusion you can make any combinations you like.

3. **Special note, the homepage uses the hero-unit for slider:**

```
<div class="hero-unit">
        <div class="slider-wrapper theme-default"></div>
</div>
```

CSS FILES

This theme uses 3 css files placed in css folder: **style.css, style-responsive.css** and **ie8.css**.

It is not recommended to make changes in **style-responsive.css** unless you know what you're doing.

In order to edit your theme style, **style.css** is the only file you should edit.

MENU AND SECTIONS

Being a single page them, beginners may feel confused while managing anchors. To keep it short and simple, **each menu** link is jumping ot click to the **section** with the **corresponding id.**

In the following example, we will create a menu link for home and its corresponding section id (page)

This is the menu link:

```
<li><a class="home" href="#home">Home</a></li>
```

This is the corresponding section:

```
<section id="home">Our home page starts here</section>
```

A second example:

This is the menu link:

```
<li><a class="portofolio" href="#portofolio">My work</a></li>
```

This is the corresponsing section:

```
<section id="portofolio">Our portofolio page starts here</section>
```

HOMEPAGE SLIDER

Afolique theme uses Nivo Slider. In order to change the existing images with your own, open **img/temp/** and replace the 3 images found. Of course, you may add as many images as you want.

Step 1: add your new images to **img/temp** folder

Step2: open **index.html** document and find the line:

```
    <div id="slider" class="nivoSlider">
```

All slider items go after this line. Add your new image as follows:

```
<a href="#"><img src="img/temp/yourimagenamehere.jpg" alt="" title="Description"/></a>
```

Linking to image (<a href="#">) is optional, leave it as is if you don't need to. Pay attention to image extensions.

Example, if your filename is <u>flowers.png</u>:

```
<a href="#"><img src="img/temp/flowers.png" alt="" title="Flowers from my garden"/></a>
```

If you filename is <u>building.jpg</u>

```
<a href="#"><img src="img/temp/building.jpg" alt="" title="Some new building "/></a>
```

IMPORTANT: Pay attention to your own image paths because in all of my examples I've considered images placed in their original folder. Images should all have the same size!

SIMPLE PORTOFOLIO

Afolique theme includes two portofolio styles: a simple one and a filterable one.

The simple portofolio has a three columns layout, each one wrapped within span4portof.

In order to change the existing images with your own, open **img/portofolio1/** and replace the 6 images found. Of course, you may also add as many as you like. Then open **index.html** document and find the line:

```
<div class="span4 portof">
```

Replace the red marked with your own:

```
<div class="span4 portof">
<img src="img/portofolio1/imagename.jpg" class="grayscale" alt="">
<div class="projectdesc">
<p>Description</p>
<p><a href="#" class="minibutton">view project</a></p>
</div>
</div>
```

If we want to get rid of the gray effect, we simply remove the grayscale class:

```
<div class="span4 portof">
<img src="img/portofolio1/imagename.jpg" alt="">
<div class="projectdesc">
<p>Description</p>
<p><a href="#" class="minibutton">view project</a></p>
</div>
</div>
```

IMPORTANT: Pay attention to your own image paths because in all of my examples I've considered images placed in their original folder. Images should all have the same size!

FILTERABLE PORTOFOLIO

1. **In order to make our portofolio filterable we need to define categories first**.

Open **index.html** document and add your categories after the line:

```
<nav class="category clearfix">
```

Define your catergories as in my example below (my category here is „people")

```
<li><a href="#" data-filter=".people">People</a></li>
```

2. **After defining categories we are ready to add the images.**

The default folder for filterable images is **img/filterable**, so upload your images there first.

Now open index.html and find the line:

```
<div class="fportfolio isotope">
```

After this line, each image should be added as below:

```
<article class="entry animals buildings isotope-item">
<img src="img/filterable/yourimagename.jpg" alt="">
<span class="hover"></span>
</article>
```

(Notice that in this example, *animals* and *buildings* are the categories in which I want my images to be displayed)

IMPORTANT: Pay attention to your own image paths because in all of my examples I've considered images placed in their original folder. Images should all have the same size!

CONTACT FORM

Open contact.php and find the line:

```
$to = 'vuzzsupport@live.com';
```

Replace this email address with your own.

That's it!
